

# Security risk assessment report

## Part 1: Select up to three hardening tools and methods to implement

Based on this incident where data breach occurs, the first hardening tool to use is SIEM (Security Information and Event Management) tools.

The second way to implement hardening tools is port filtering.

The last way for hardening tools is security segmentation.

## Part 2: Explain your recommendations

Based on this incident where data breach occurs, first use SIEM tools to keep track of security data, alerts, collect and analyze log data, it acts as a “single glass of pane”. This tool is required to be done regularly to check any anomalies in log data.

Another way to implement hardening tools is port filtering, which blocks all unwanted traffic, and allows only legitimate traffic, to reduce unwanted communication. Port filtering needs to be done once on firewalls.

The last way for hardening tools is, security segmentation, which allows different departments to be segmented so that if data breach occurs, it does not spread across other departments, and can be dealt with properly. This generally has to be implemented on regular basis.
