

Incident report analysis

Instructions

As you continue through this course, you may use this template to record your findings after completing an activity or to take notes on what you've learned about a specific tool or concept. You can also use this chart as a way to practice applying the NIST framework to different situations you encounter.

Summary	Overall, the multimedia company has recently encountered a DoS(Denial of Service) attack where packets were flooded with ICMP packets. It causes our internal system to delay and compromise for two hours, and becomes a huge burden to customers and users. Therefore, in order to resolve this quickly, we instantly block any incoming ICMP packets(configure new firewall rules), check for any incoming spoofed IP addresses on ICMP packets, check for any anomaly traffics, turning all network services offline, restoring critical network services, and lastly with IDS/IPS to check for intrusion traffic as ICMP packets. That also impacted customers who regularly use this website to complain and unable to resolve troubleshooting for almost two hours. Therefore, the targeted system is to block or delay further network operations and make the system offline after ICMP flooding. Overall, our team found that a malicious actor had sent a flood of ICMP pings into the company's network through an unconfigured firewall. This vulnerability allowed the malicious attacker to overwhelm the company's network through a denial of service (DoS) attack.
----------------	--

Identify	The type of attack that occurred is ICMP attack under DoS/Denial of Service after the incident management team has tackled this issue. After the attack occurred, our system becomes very slow and incident management team checked all possible issues.
Protect	Our team has worked on implementing new firewall rules to check for traffic anomalies, filter ports, check IP address, etc. Also, they checked for spoofed IP addresses on incoming ICMP packets. Then they made an IDS/IPS system to filter out some ICMP traffic based on suspicious characteristics.
Detect	To detect inconsistency in the system they used IDS - Intrusion detection system to actually warn the network administrator.
Respond	To take actions, we used IPS to alert and automatically block any similar network traffic, malicious IP address out of ordinary, etc. Also, our team blocked all incoming ICMP packets, stopping all critical networks offline, restoring critical network services. In case customer are still not satisfied with this services that was delayed for two hours, we informed customers to mail our support specialist and will inform law enforcement to tackle this issue.
Recover	After detecting and responding to this issue, our team has made a backup file to retrieve and store it in another hard disk drive to store any important information and data left. Due to this backup, some information and data in our company system might have changed and therefore might not have been saved, so we have informed to our customer and other staff members.

Reflections/Notes:
